

SGOM Data Checklist: Watered-Out Well Analysis

Required inputs for automatic mixed-Rw waterflood correction and injection-share estimation
SGOM — AI for Bypassed Pay & Well Restoration · bypassed pay detection and well restoration ranking

1. Well data

- ☐ Identifier: API / UWI, field, formation
- ☐ Total depth, datum; perforation intervals (top / bottom, dates)

2. Open-hole logs

- ☐ GR, resistivity (RT / LLD / ILD) required
- ☐ Porosity: density, neutron, sonic
- ☐ Caliper
- ☐ Formats: LAS, scanned paper logs (PDF / JPG) OCR built in

3. Production history

- ☐ Monthly oil & water rates (bbl), water cut CSV / Excel
- ☐ Cumulative production volumes

4. Injection data

- ☐ Injector wells (name / API) and injection formation
- ☐ Injection volumes (bbl/day), operating period monthly detail

5. Water salinity

- ☐ Formation water analysis: TDS, ppm / mg/l (ion composition if available) one analysis is enough
- ☐ Injected water salinity, ppm / mg/l
- ☐ Reservoir temperature, °F

6. Optional — improves accuracy

- ☐ Reservoir pressures (RFT / MDT / DST), core data
- ☐ Cased-hole surveys (pulsed neutron, RST) confirms water source

Minimum required to start

Items 4 (injection) and 5 (formation & injected water salinity). The injection share in producer inflow is estimated from injection history — no manual input required.
